DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 9/5/2007 & 9/25/2007 has been entered.

Response to Arguments

2. Applicant's arguments with respect to claim 27 have been considered but are moot in view of the new ground of rejection.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Art Unit: 2622

3. Claim 27 is rejected under 35 U.S.C. 102(e) as being anticipated by Arakawa (US 6,031,751).

Regarding claim 27, Arakawa discloses a solid-state image sensor (Figs. 1-7) comprising:

unit pixels (pixels 101 in Fig. 1) each having a photoelectric conversion element (Figs. 2 or 4) for converting incident light into electric signal charge and then storing (in floating diffusion 1) the signal charge obtained through such photoelectric conversion (see col. 1, lines 35-54 and col. 5, lines 46-64); an amplifying element (source follower circuit 9) for amplifying the signal charge stored in said photoelectric conversion element into an electric signal (col. 1, lines 55-63); and a reset element (3) for resetting said signal charge, said reset element being a depletion transistor (see col. 1, lines 49-54), wherein the reset gate of said depletion transistor is a transverse overflow barrier (see Figs. 2 or 4 and col. 1, lines 49-54, wherein the reset gate 3 is considered as a transverse overflow barrier since it creates an overflow barrier indicated by $\Phi 1$ and $\Phi 2$ which is transversely located by virtue of the width of the reset gate).
